

Mobi Media Quintet24 Release

Dezember 2023: Retailer

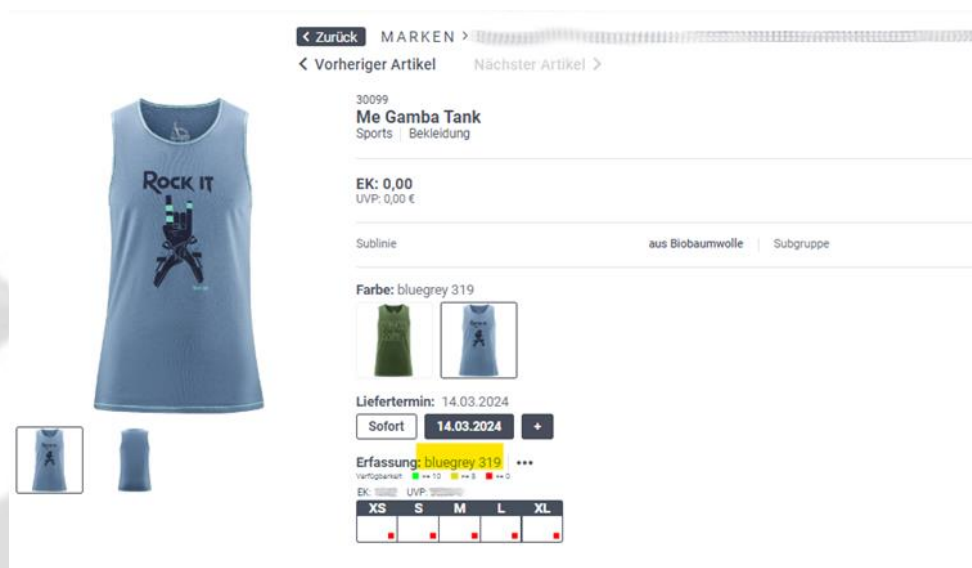

1. New functionalities

❖ Fast entry – Redesign:

The view for the fast entry of articles has been adjusted. More information about the article is now visible, which is displayed in a reduced view of the article detail page. This makes it possible, for example, to easily write quantities for color alternatives of the same article using the fast entry feature.

❖ Displaying color names in the article detail view

A small adjustment is that the color name of the selected color is now also displayed above the entry grid in the article detail view, so that it is no longer possible to mistake the color that has just been entered

• Mixed quantity units in the shopping cart:

If articles with different quantity units are entered in a shopping cart, e.g. pieces or pairs, the quantity unit of the first article entered is no longer displayed at summarized level, instead there is no unit at all. In the shopping cart, the correct quantity unit belonging to the article is then displayed at article level.

2. Improvements

- A store/delivery address can be temporarily changed within a shopping cart. As soon as the shopping cart is completed, the changed store/delivery address disappears from the list of stores/delivery addresses.
- Optimization of the image download
- Improvement of the display behavior of text fields in workbooks
- Improvement of the display behavior of the shows on the brand page

3. Outlook

We are currently working on the following major functions, which we want to make available in the next release by the end of the year:

❖ **Store class distribution with multigrid**

In future, retailers with several stores will be able to combine their stores into groups or classes. To make the quantity entry as convenient as possible, the store classes or stores are displayed as rows directly during the entry. It is possible to switch from the store class to the individual stores at any time so that individualization can be carried out immediately. The functionality is still undergoing final tests and will be released by the end of the year. A more detailed description will then appear in the next update information.

❖ **Statistical analysis:**

There will be the possibility of an extended statistical analysis, which will enable the retailer to determine the dimensions and metrics himself.

❖ **„One-Click-Order“:**

In future, suppliers will be able to provide complete workbooks with default quantities so that retailers can add entire packages to the shopping cart with just a few clicks. It is also possible to enter a factor that multiplies the stored default quantities accordingly. You will also receive more detailed information on this in the next update information.
