

### 1. New features

#### Optimisation of the zoom functions in the workbook:

The zoom can now be increased or decreased in several stages. Click on the 'magnifying glass':

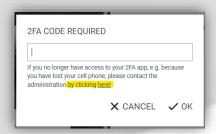

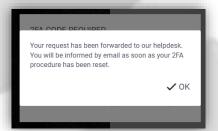

The 'Browse mode' now switches to 'Scroll mode' and the first page is displayed at the first zoom level. By clicking on '+' or '-', you can further increase or decrease the zoom. By clicking on '-', you automatically return to 'Browse mode' after the smallest zoom level.

#### \* Reset for 2FA authentication:

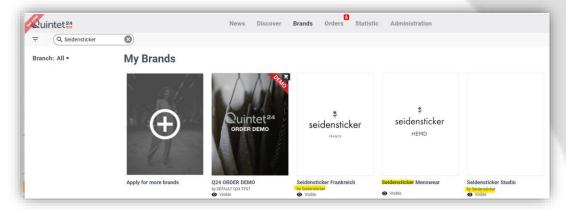

If you have chosen the 2FA procedure for secure authentication and have lost your smartphone, there was previously no way to log back into Quintet24. Now, when prompted to enter the 2FA code, you can request a reset of the function. Once our administrators have performed the reset, you will be automatically notified by email. You can then log in again without 2FA authentication and set up a new 2FA configuration in your profile.

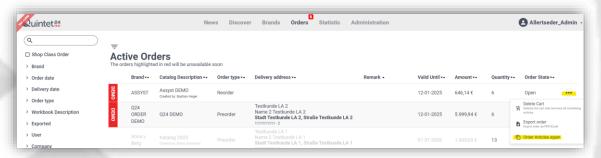

#### Additional search for supplier names:

In BRANDS, you can now search for the supplier name in addition to the brand name.

#### Copy orders to a new shopping cart:

Completed shopping carts can be moved from orders to a new shopping cart via the context menu (three dots at the end of the line) and thus reordered.

#### Terms and Conditions/GDPR:

If changes are made to MobiMedia's Terms and Conditions or GDPR, these will now be displayed to the user again and the confirmation will be saved.

## 2. Improvements

#### Item entry:

The legend for the stock figures is now slightly larger and therefore easier to read. In addition, the purchase price is hidden above the entry grid in the vertical grid, as it is displayed in the cells below for each size anyway.

# Improved article search in the workbook overview and within workbooks:

The article search has been made more flexible so that minor spelling mistakes or

different spellings and upper- and lower-case letters are also taken into account. The results are sorted by weighting so that the best hits are at the top of the list. However, this new logic also means that articles are found that have little or nothing to do with the desired search term, for example, if parts of the search term are contained in other contexts. Such articles should appear further down the list. You are probably familiar with this type of search logic from Amazon, Google or other portals. Here, too, the further down the list you go, the more questionable the relevance of the results becomes.

#### System performance:

The speed of the system has been improved in various areas:

- o Opening the workbook overview for a brand
- o Opening a workbook
- o Full-text search for very large shopping baskets and branch orders
- Update information: The window that appears is now better scaled.
- When sharing without a template, the mandatory assortment now correctly adopts the default quantities.
- Export marketing documents no longer show duplicate items.
- Q24 app: various mobile views have been improved.
- ❖ The T&Cs/GDPR link during registration now works again.
- The brand overview can now scroll down again on 4K monitors.
